## Outline

- Precipitation Reactions
- Acid-Base Reactions
- Net-Ionic Equations
- Oxidation-Reduction Reactions
- Classification of Reactions
- Titrations

## Precipitation Reactions

Aqueous solutions are those in which water is the dissolving medium

Solution - a homogeneous (uniform composition) mixture
Solvent - the major component of a solution
Solute - the minor component of a solution

Ability of water to dissolve substances results from its unequal charge distribution
"Charged ends" of water molecule interact with solute molecules (ions)

Salts (ionic compounds) dissolve in a process called dissociation

"Negative end" attracted to cation
"Positive end" attracted to anion

Ions surrounded by water molecules are said to be solvated
Ions in solution can react to form insoluble substance (precipitate)

Reactions that form precipitates are precipitation reactions
Products of precipitation reactions determined from ion exchange and solubility rules
$2 \mathrm{NaCl}(\mathrm{aq})+\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq}) \rightarrow 2 \mathrm{NaNO}_{3}(\mathrm{aq})+\mathrm{PbCl}_{2}(\mathrm{~s})$
$\mathrm{BaBr}_{2}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \rightarrow \mathrm{BaSO}_{4}(\mathrm{~s})+2 \mathrm{NaBr}(\mathrm{aq})$
$2 \mathrm{KOH}(\mathrm{aq})+\mathrm{CaCl}_{2}(\mathrm{aq}) \rightarrow 2 \mathrm{KCl}(\mathrm{aq})+\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s})$
$3 \mathrm{Na}_{2} \mathrm{~S}(\mathrm{aq})+2 \mathrm{FeI}_{3}(\mathrm{aq}) \rightarrow 6 \mathrm{NaI}(\mathrm{aq})+\mathrm{Fe}_{2} \mathrm{~S}_{3}(\mathrm{~s})$

## Acid-Base Reactions

Brønsted - Lowry acids are substances capable of donating hydrogen ions ( $\mathrm{H}^{+}$)

Brønsted - Lowry bases are substances capable of accepting hydrogen ions ( $\mathrm{H}^{+}$)

Acids react with bases by transferring hydrogen ions ( $\mathrm{H}^{+}$)

$$
\mathrm{HCl}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

Acid-base reactions are termed neutralization reactions...
the reactions produce "hot salty water"!

Predict the products...

$$
\begin{aligned}
& \mathrm{HBr}(\mathrm{aq})+\mathrm{LiOH}(\mathrm{aq}) \rightarrow \mathrm{LiBr}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \\
& \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{Ba}(\mathrm{OH})_{2} \rightarrow \mathrm{BaSO}_{4}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})
\end{aligned}
$$

Some products in aqueous reactions are gaseous...

$$
\begin{aligned}
& \mathrm{H}_{2} \mathrm{~S}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) \\
& \mathrm{H}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{SO}_{2}(\mathrm{~g}) \\
& \mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{NH}_{3}(\mathrm{~g})
\end{aligned}
$$

If water accepts a hydrogen ion it forms hydronium ion

$$
\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{H}^{+}(\mathrm{aq}) \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})
$$

Acid molecules undergo ionization when dissolved into water

$$
\mathrm{HCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})
$$

Acids that ionize completely are strong acids
$\mathrm{HCl}, \mathrm{HBr}, \mathrm{HI}, \mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{HNO}_{3}, \mathrm{HClO}_{3}, \mathrm{HClO}_{4}$
Bases that dissociate completely are strong bases alkali metal hydroxides, $\mathrm{Ca}(\mathrm{OH})_{2}, \mathrm{Sr}(\mathrm{OH})_{2}, \mathrm{Ba}(\mathrm{OH})_{2}$

## Net-Ionic Equations

formula equation: all reactants and products, no individual ions
total ionic equation: all reactants and products are given as ions
net ionic equation: includes only those species involved in reaction

In net-ionic equations...

Soluble salts, strong acids, and strong bases are written in "ionic form"

Insoluble salts, weak acids, weak bases, and soluble molecular compounds are written in "molecular form"

Write in net-ionic form...

$$
\begin{aligned}
& \mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq}) \rightarrow \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{PbCl}_{2}(\mathrm{~s}) \\
& \text { nie: } 2 \mathrm{Cl}-(\mathrm{aq})+\mathrm{Pb}^{2+}(\mathrm{aq}) \rightarrow \mathrm{PbCl}_{2}(\mathrm{~s}) \\
& \mathrm{CdS}(\mathrm{~s})+2 \mathrm{HNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{Cd}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) \\
& \text { nie: } \mathrm{CdS}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow \mathrm{Cd}^{2+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) \\
& 2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow 2 \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \text { nie: } 2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{CO}_{3}^{2-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
\end{aligned}
$$

Spectator ions do not participate in the chemical reaction...

## Oxidation-Reduction Reactions

Reactions involving the transfer of electrons are oxidationreduction reactions (redox reactions)

Oxidation is the loss of electrons
Reduction is the gain of electrons

Oxidation always accompanies reduction!

Oxidation numbers are used to keep track of electrons in redox reactions

Oxidation increases oxidation number
Reduction decreases oxidation number

The oxidation number...
...of atoms in elemental state is 0
...of monatomic ions is equal to charge of ions
...is +1 for Group I metals and +2 for Group II metals
...is usually +1 for hydrogen (except with metal hydrides)
...is usually -2 for oxygen (except with peroxides)
...is negative for the most electronegative atom in a compounds (and equal to charge of the ion)

The sum of oxidation numbers...
...in a compound is equal to zero
...in polyatomic ions is equal to charge of ion

Reducing agents cause something to be reduced (it's oxidized)
Usually: metals, $\mathrm{H}_{2}$, elemental C
Oxidizing agents cause something to be oxidized (it's reduced)
Usually: halogens, $\mathrm{O}_{2}, \mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}, \mathrm{MnO}_{4}^{-}, \mathrm{HNO}_{3}, \mathrm{H}_{2} \mathrm{O}_{2}$

Products of redox reactions...

$$
\begin{aligned}
& \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-} \rightarrow \mathrm{Cr}^{3+} \text { (acidic) } \\
& \mathrm{MnO}_{4}^{-} \rightarrow \mathrm{Mn}^{2+} \text { (acidic) } \\
& \mathrm{MnO}_{4}^{-} \rightarrow \mathrm{MnO}_{2} \text { (basic) } \\
& \mathrm{HNO}_{3} \rightarrow \mathrm{NO}_{2} \\
& \mathrm{H}_{2} \mathrm{O}_{2} \rightarrow \mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

In redox reactions, electrons gained by one element must equal electrons lost by another element!

Redox reactions balanced with the half-reaction method

1. Determine oxidation numbers
2. Write half-reactions for oxidation and reduction
3. Balance half-reactions with "MOHe"

M - miscellaneous atoms
O - oxygen atoms (with $\mathrm{H}_{2} \mathrm{O}$ )
H - hydrogen atoms (with $\mathrm{H}^{+}$)
e - electrons
4. Equalize electrons transferred
5. Combine half-reactions
$\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}+\mathrm{Sn}\left(\mathrm{NO}_{3}\right)_{2} \rightarrow$ ??? (assume acidic conditions)
$\mathrm{K}^{+}+\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+\mathrm{Sn}^{2+}+\mathrm{NO}_{3}^{-} \rightarrow$ ???
$\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}+\mathrm{Sn}^{2+} \rightarrow \mathrm{Cr}^{3+}+\mathrm{Sn}^{4+}$ (unbalanced)
red: $\quad 6 \mathrm{e}^{-}+14 \mathrm{H}^{+}+\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-} \rightarrow 2 \mathrm{Cr}^{3+}+7 \mathrm{H}_{2} \mathrm{O}$
ox: $\quad 3 \mathrm{Sn}^{2+} \rightarrow 3 \mathrm{Sn}^{4+}+6 \mathrm{e}^{-}$
redox: $\quad 14 \mathrm{H}^{+}+\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+3 \mathrm{Sn}^{2+} \rightarrow 2 \mathrm{Cr}^{3+}+3 \mathrm{Sn}^{4+}+7 \mathrm{H}_{2} \mathrm{O}$
$\mathrm{KMnO}_{4}+\mathrm{NaI} \rightarrow \quad$ ??? (assume basic conditions)
$\mathrm{K}^{+}+\mathrm{MnO}_{4}^{-}+\mathrm{Na}^{+}+\mathrm{I}^{-} \rightarrow$ ???
$\mathrm{MnO}_{4}^{-}+\mathrm{I}^{-} \rightarrow \mathrm{MnO}_{2}+\mathrm{I}_{2}$ (unbalanced)
red: $\quad 6 \mathrm{e}^{-}+8 \mathrm{H}^{+}+2 \mathrm{MnO}_{4}^{-} \rightarrow 2 \mathrm{MnO}_{2}+4 \mathrm{H}_{2} \mathrm{O}$
ox: $\quad 6 \mathrm{I}^{-} \rightarrow 3 \mathrm{I}_{2}+6 \mathrm{e}^{-}$
redox: $\quad 8 \mathrm{H}^{+}+2 \mathrm{MnO}_{4}^{-}+6 \mathrm{I}^{-} \rightarrow 2 \mathrm{MnO}_{2}+3 \mathrm{I}_{2}+4 \mathrm{H}_{2} \mathrm{O}$
redox:
$4 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{MnO}_{4}^{-}+6 \mathrm{I}^{-} \rightarrow 2 \mathrm{MnO}_{2}+3 \mathrm{I}_{2}+8 \mathrm{OH}^{-}$

## Classification of Reactions

combination:
simpler substances form complex substance
$A+B \rightarrow A B$
decomposition: complex substance forms simpler substances

$$
A B \rightarrow A+B
$$

single-displacement: one element displaces another

$$
A+B X \rightarrow B+A X
$$

double-displacement: two elements (groups) displace one another

$$
\mathrm{AX}+\mathrm{BY} \quad \rightarrow \mathrm{AY}+\mathrm{BX}
$$

## Titrations

Titration is a procedure for determining amount of a substance in solution

Titrant of known concentration is added to analyte of unknown concentration

The complete reaction between titrant and analyte occurs at the equivalence point

Molarity ( $M$ ) is the number of moles of solute per liter of solution

$$
\text { Molarity }=\frac{\text { mol solute }}{\text { L solution }}
$$

Dilution is when more solvent is added to lower the concentration of the solution

$$
M_{c} \times V_{c}=M_{d} \times V_{d}
$$

How many mL's of $0.45 \mathrm{M} \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ are needed to titrate 25.0 mL of $0.23 \mathrm{M} \mathrm{Sn}\left(\mathrm{NO}_{3}\right)_{2}$ ?

$$
14 \mathrm{H}^{+}+\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+3 \mathrm{Sn}^{2+} \rightarrow 2 \mathrm{Cr}^{3+}+3 \mathrm{Sn}^{4+}+7 \mathrm{H}_{2} \mathrm{O}
$$

$25.0 \mathrm{~mL} \times \frac{0.23 \mathrm{~mol} \mathrm{Sn}^{2+}}{\mathrm{L}} \times \frac{1 \mathrm{~mol} \mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}}{3 \mathrm{~mol} \mathrm{Sn}^{2+}} \times \frac{1 \mathrm{~L}}{0.45 \mathrm{~mol} \mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}}=4.3 \mathrm{~mL}$

What is the concentration of a NaCl solution if a 10.0 mL sample require 42.3 mL of $0.25 \mathrm{M} \mathrm{KMnO}_{4}$ to reach the equivalence point under acidic conditions?
$\mathrm{KMnO}_{4}+\mathrm{NaCl} \rightarrow$ ???
$\mathrm{MnO}_{4}^{-}+\mathrm{Cl}^{-} \rightarrow \mathrm{Mn}^{2+}+\mathrm{Cl}_{2}$
$16 \mathrm{H}^{+}+2 \mathrm{MnO}_{4}^{-}+10 \mathrm{Cl}^{-} \rightarrow 2 \mathrm{Mn}^{2+}+5 \mathrm{Cl}_{2}+8 \mathrm{H}_{2} \mathrm{O}$
$42.3 \mathrm{~mL} \times \frac{0.25 \mathrm{~mol} \mathrm{MnO}_{4}^{-}}{\mathrm{L}} \times \frac{10 \mathrm{~mol} \mathrm{Cl}^{-}}{2 \mathrm{~mol} \mathrm{MnO}_{4}^{-}}=52.87 \mathrm{mmol} \mathrm{Cl}^{-}$
$52.87 \mathrm{mmol} \mathrm{Cl}^{-}$ 10.0 mL

How many grams of copper can be oxidized to copper(II) by 55 mL of $1.0 \mathrm{M} \mathrm{HNO}_{3}$, assuming complete reaction?

$$
\mathrm{Cu}+\mathrm{HNO}_{3} \rightarrow \text { ??? }
$$

$$
\mathrm{Cu}+\mathrm{NO}_{3}^{-} \rightarrow \mathrm{Cu}^{2+}+\mathrm{NO}_{2}
$$

$$
4 \mathrm{H}^{+}+\mathrm{Cu}+2 \mathrm{NO}_{3}^{-} \rightarrow \mathrm{Cu}^{2+}+2 \mathrm{NO}_{2}+2 \mathrm{H}_{2} \mathrm{O}
$$

$55 \times 10^{-3} \mathrm{~L} \times \frac{1.0 \mathrm{~mol} \mathrm{NO}_{3}^{-}}{\mathrm{L}} \times \frac{1 \mathrm{~mol} \mathrm{Cu}^{2}}{2 \mathrm{~mol} \mathrm{NO}_{3}^{-}} \times \frac{63.55 \mathrm{~g}}{1 \mathrm{~mol}}=\underline{1.7 \mathrm{~g} \mathrm{Cu}}$
